Sinks for the Toughest Worksite

ReadySink

Sinks for the Toughest Worksite

 **PRO**

 **Plus**

 **Basic**

FEATURES

-  Stainless Steel Sink
-  Welded Steel Frame
-  Powder Coat Finish, Zinc Primer
-  Room for Accessories

OPTIONS

-  Touchless & Hands-Free Control
-  Dispenser Panel
-  Shelf
-  Tankless Heater

Sinks for the Toughest Worksite

In 1987, OSHA published a Final Rule for Field Sanitation, 29 CFR1928.110. Among other things, it requires that all employers of 11 or more hand laborers in the field provide adequate hand washing facilities, including potable water, soap, and single-use towels. OSHA based the determination that the waterless cleaners were not adequate substitutes primarily on the expert testimony of a number of health professionals. Some health professionals commented that packaged moist towelettes, as opposed to soap and water, do not prevent the spread of harmful bacteria, communicable disease, or pesticide poisoning. In fact, some health experts testified that moist towelettes would increase the risk of infection, especially from pesticides. Lastly, health professionals testified that the availability of potable water on jobsites was important for treating or flushing eye or skin injuries where there is contact with pesticides or other hazardous contaminants.

OSHA then concluded that:

On the basis of all evidence in the record, OSHA has decided to require handwashing facilities, as proposed. The Agency believes the evidence from health professionals is conclusive. The use of soap and water effectively reduces multiple hazards, while the use of soap-and-water substitutes could increase them.
